

Separate adversary engagement from production.

The Surface exposes only the profiles and targets selected for the mission. Adversaries interact with HIIH Contact Points or Live Hosts while customer production assets remain outside the hostile execution path.

Outbound activity is governed by the operating policy and deployment controls. This separation does not mean that every attack against production is diverted to HIIH: existing production controls remain in use.

RESPONSIBILITIES

OHIIHO

Deploys and operates the Surface, collects and structures results, and implements the controls.

Partner, where applicable

Runs the client service, L1/L2 workflow, reporting, and service obligations.

Customer

Brings the mission, names authorized users, and uses the results.

AREA	PRINCIPLE
Collection	Follows the target and the engagement depth. Material presented by an adversary may concern third parties, so access and reuse require explicit controls.
Access and retention	Hosting, retention, authorized users, minimization, and export conditions are documented for your deployment.
Separation	Customer-specific evidence and outputs are logically separated. Any cross-Surface correlation requires a separately governed path.
Research	Publication requires review and sanitization; it is not an automatic downstream use of customer data.

The technical edition of this brief details the data classes and the responsibility model. It is provided on request, as a nominative copy.
